                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated peptide which is 5-23 amino acids in length, and comprising phenylalanine, leucine, alanine or lysine residues, or contains at least 50 % of the residues. The peptides of the invention have antibacterial, fungicide, cytostatic, and vulnerary activity. The peptides are useful in treating cancer, cystic fibrosis or and/or proliferation of human fibroblasts and lymphocytes, promoting wound healing, and in enhancing the activity of a therapeutic agent. The sequences shown in ABR00759-ABR00923 represent the bioactive peptides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated peptide for treating cancer, cystic fibrosis, wounds or acne, inhibiting growth of microbial cells, or promoting proliferation of cells, comprises phenylalanine, leucine, alanine or lysine residues.
                                                                                                                                                                                                                                                        Antibacterial; fungicide; cytostatic; vulnerary; cancer; cystic fibrosis; acne; attimicrobial; human fibroblast; human lymphocyte; wound healing; bioactive.

organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXXB and its derivatives selected from XZBBZBXXBX. BXZXZBX XBBXXZBXB and its derivatives selected from XZBBZBXXBX BXZXBX BXXZXBX XBBXXBBX and BBXZBBXZ; and (b) as second peptide template XBBXXXBX XBXXBXXB and BBXZBBXZ; and (b) XZBZXBBXXZBBX; where B = at least one positively charged amino acid; and where B, X and Z may be separated by one or more other amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal netrophials. The peptides overall effect cellular disruption and rapid appoptosis of microbial cells. AAY57463 to AAX57557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention describes an antimicrobial peptide (AP) for direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated peptide which is 5-23 amino acids in length, and comprising phenylalanine, leucine, alanine or lysine residues, or contains at least 50 % of the residues. The peptides of the invention have antibacterial, fungicide, cytostatic, and vulnerary activity. The peptides are useful in treating cancer, cystic fibrosis or and/or proliferation of human fibroblasts and lymphocytes, promoting we stimulation and/or proliferation of human fibroblasts and lymphocytes, promoting wound healing, and in enhancing the activity of a therapeutic agent. The sequences shown in ABR00759-ABR00923 represent the bioactive peptides of
                                                                                                      Antibacterial; fungicide; cytostatic; vulnerary; cancer; cystic fibrosis; acne; antimicrobial; human fibroblast; human lymphocyte; wound healing; bioactive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated peptide for treating cancer, cystic fibrosis, wounds or acne, inhibiting growth of microbial cells, or promoting proliferation of cells, comprises phenylalanine, leucine, alanine or lysine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fundi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers,

truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also concluded are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide composition for direct activity or for potentiating antimicrobial apents active against organisms such as bacteria and fundi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fundion; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents.

Ceres separations are thance, potentiate or restore efficiacy of antimicrobial peptides are useful as individual antimicrobial agents.

Conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in fooder and as agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in the loop techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic or resistence. They exhibit lower inherent mammalian cell toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaini
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                antimicrobial peptide composition for the prevention and treatment of setions caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                           to an antimicrobial peptide composition for use

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZENENE and its derivatives selected from XZBENENENE, BXZXEB, XBENZXEBS and its derivatives a second peptide template XBEXX BENZXEBS and their derivatives selected from the group consisting of XBBXEBS, BXZASEB, BXZASEB, and XBBZXXBENZYEBES, where B = at least one positively charged amino acid; X = at least one aromatic amino acid; and where B, X and Z amay be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAX57557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                    Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

peptides for potentiating antimicrobial agents active against bacteria and fungi.

Claim 17; Page 106; 166pp; English.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting eslected from XEBERMENE, MEXEXTSHE, KEBEXTSHER and BEXEBEX; and (b) a second peptide template XEBERMENE, MEXEXTSHE, ABEXERMEN, THE SECOND CONSISTING A SECOND CONSISTING A SECOND CONSISTING A SERVENCE AND ACCOUNTY ACCO

New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance

Example; Page 72; 221pp; English

The invention relates to an antimicrobial peptide composition for use

against organisms such as bacteria and fungi comprising a peptide of 5150 amino acids containing a 7-13 amino acid core sequence (derived from
150 amino acids containing a 7-13 amino acid core sequence (derived from
150 amino acids containing a 7-13 amino acid core sequence (derived from
150 amino sextensions, combinations and their derivatives. The
151 possible structures are fully described in the specification. Also
152 core included are (1) an antimicrobial agents active against organisms such as
153 core sequence selected from truncations of the peptides described above,
154 core sequence selected from truncations and fulsions; and (2)
155 antimicrobial peptides for potentiating antimicrobial activity of
156 antimicrobial peptides are useful as individual antimicrobial agents
157 conventional antimicrobials, agents that enhance the antimicrobial agents
158 conventional antimicrobials, agents that enhance the antimicrobial
158 conventional antimicrobials, agents to improve efficiency of molecular
159 techniques. Antimicrobial peptides of prior art have generally
158 considered to have undesirable toxicity, immunogenicity and short
159 considered to bave undesirable toxicity, immunogenicity and short
159 controm of the partial antimicrobial peptides of the present invention
150 considered to bave undesirable toxicity, immunogenicity and short
150 controm problems of toxicity, immunogenicity, and short considered problems of toxicity, immunogenicity, and short considered problems of toxicity, immunogenicity, and short considered problems of toxicity immunogenicity, and short considered problems of toxicity immunogenicity, and short considered problems of toxicity immunogenicity, and short in the peptides of farming and and antimicrobial antimicro of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

Antimicrobial peptides for potentiating antimicrobial agents active

```
ö
                                                              activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBAZKABB and its derivatives selected from XZBBZBXBKB, BXZXXB, XBBXZXBBX and BBXZBBXZ; and (b) as second peptide template XBBXXXBXX XBBXXBBX and BBXZBBXZ; and (b) group consisting of XBBXBBX, RBXXBXXB, XBBXXXBB, and ABBZXXBBXXZBBX; where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophials. The peptides overall effect callular disruption and rapid appotests of microbial cells. ANY57463 to AAY57557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBARNENE and its derivatives selected from XZBABSKEX, BAZZAB, XBAZZABNZ and BBXZBBXZ; and (b)
                                               invention describes an antimicrobial peptide (AP) for direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antimicrobial peptides for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        67.6%; Score 50; DB 2; Length 19; 90.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial apents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
a second peptide template XBBXX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBZXXBB, and XBBZXXBBX; where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid, Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of
                                                                                                                                                                                                                                                             neutrophile. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAV57463 to AAV57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antimicrobial peptide composition for use

```
antimicrobial peptides are useful as individual antimicrobial agents,

specifically against bacteria and fungi, agents in combination with other
artimicrobials, agents that enhance, potentiate or restore efficacy of
conventional antimicrobials, agents that enhance the antimicrobial

functions of leukocytes, as disinfectants or preservatives for use in

cods and comedites and as agents to improve efficiency of molecular

biology techniques. Antimicrobial peptides of prior art have generally

been considered to have undesirable toxicity, immunogenicity and short

considered to have undesirable toxicity, immunogenicity and short

are based upon natural antimicrobial peptides that have potent and broad

spectrum activity against pathogens exhibiting multiple antibiotic

cresistance. They exhibit lower inherent mammalian cell toxicities and

overcome problems of toxicity, immunogenicity, and shortness of durantion

of effectiveness due to biodegradation, retaining activity in plasma and

serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rabbit platelet microbicidal protein, PMP-2, based peptide #37.

a second peptide template XBBXX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBZXBBB, and SEBZXBBX; where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7463 to AAYS7557 represent sequences used in the exemplification of the present invention

Sequence 20 AA;

bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and artimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of leukocytes against bacteria as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agants that enhance the antimicrobial agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular bloodsy techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic cresistants and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and covercome problems of sourcent problems expended antimic Gaps Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis. ö 67.6%; Score 50; DB 5; Length 19; 90.9%; Pred. The invention relates to an antimicrobial peptide composition for use (HARB-) HARBOR-UCLA RES & EDUCATION INST. Example; Page 72; 221pp; English. 25-AUG-2000; 2000US-00648816. Yeaman MR, Shen AJ; WPI; 2002-590659/63.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXB, BXZXZB, XBBXZXBBX and BBXZBBXZ; and (b)

Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acid corre sequence (derived from 150 amino acids containing a 7-13 amino acid corre sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also concluded are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents.

Corresponded are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial control foods and cosmetics and as disinfectants or preservatives for use in foods and cosmetics and a gents that to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally
                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ğ
amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7463 to AAXS7557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection; fungicide, disinfectant; preservative, foods, cosmetic, multiple antibiotic resistance, rabbit.

been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory condition

Claim 1; SEQ ID NO 1; 103pp; English.

The present sequence is that of Protide-1 (PT-1), a peptide antibiotide with distinct effector and activator domains. PT-1 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific for staphylococcus VB protease. PT-1 was designed to be cleaved into 2 distinct effectors in the presence of VB protease. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the absence of VB protease produced by Staphylococcus aureus. Thus, PT-1 was synthesised by solidal activity in the context of infections due to staphylococcal cells elaborating the virulence factor VB protease. PT-1 was synthesised by solid-phase synthesis. It is an example of context-activated procides of the invention that have 2 or more effectors with individual distinct biological functions and one or ADIJO2755

Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi

Disclosure; Page 126; 166pp; English

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against conganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZEXEBE and its derivatives selected from XZBEZEREBE BEZZEREBE BEZZEREBE AND BEZZEREBE A neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences apoptogis of microbial cells. AAY57463 to AAY57557 reused in the exemplification of the present invention

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-

(150 amino acids containing a 7-13 amino acid core sequence (derived from 150 amino acids containing a 7-13 amino acid core sequence (derived from 150 amino acids containing a 7-13 amino acid core sequence (derived from 150 amino acids composition), and retromers, truncations, extensions, combinations, funcions and their derivatives. The possible structures are fully described in the specification. Also or for potentiating antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising, a peptide of 13-74 containing an amino acid antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial against bacteria and fungi, agents in combination with other specifically against bacteria and fungi, agents in combination with other conventional antimicrobials, agents that enhance the antimicrobial activity of functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular conventional antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic or esistence. They exhibit lower inherent mammalian cell toxicity and overcome problems of toxicity, immunogenicity, and schotterial and companient or resistence from pathogens are abbit pymp based antimicrobial peptide or esistence is a rabbit pymp based antimicrobial peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptide composition for the prevention and treatment
by organisms, such as bacteria and fungi, exhibiting

The present sequence is that of Protide-2 (PT-2), a peptide antibiotide with distinct effector and activator domains. PT-2 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (Interleukin-8 domain) and an activator site specific contextase, a complement fixing protease. PT-2 is cleaved into 2 for C3 convertase, in the presence of C3 convertase. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the presence of C3 convertase. Thus, PT-2 was designed to exert optimal antimicrobial activity in the complement pathways that make up the complement system, which is part of the innate immune response to antigen exposure. PT-2 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory

Brass EP;

Edwards JE,

The present sequence is that of Protide-3 (PT-3), a peptide antibiotide with distinct effector and activator domains. PT-3 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (RP-1), and an activator site specific for thrombin. PT-3 was designed to be cleaved into 2 distinct effectors in the presence of thrombin. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the absence of thrombin, but equivalent to or exceeding that of RP-1 in the presence of thrombin. Thus, PT-3 exerts optimal antimicrobial activity in the context of thrombin as would be present in the setting of vascular injury or infection. PT-3 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological ö Gaps .; 0 Score 50; DB 8; Length 37; Pred. The present sequence is that of Protide-4 (PT-4), a peptide antibiotide with distinct effector and activator domains. PT-4 concains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like antimicrobial peptide effector (Interleukin-8 domain) and an activator site specific for matrix metalloproteinase MMP-9, which is produced to dissolve the tissue in front of the growing blood vessel tip to allow for its continued tissue invasion. PT-4 was designed to be cleaved into 2 distinct effectors in the presence of MMP-9. In particular, PT-4 exerts antimeoplastic and/or antimicrobial activity less than that of RP-1 in the presence of MMP-9, but equivalent to or exceeding that of RP-1 in the presence of MMP-9, the context of new blood vessel formation. PT-4 exerts of an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one cor more effectors with individual distinct biological functions and one cor more corresponding activator sites that can each initiate or amplify the protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide containing a 7-13 amino acide core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents.

CC antimicrobial peptides are useful as individual antimicrobial agents (antimicrobial peptides are useful as individual antimicrobial activity of conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short or are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic considered to have undesirable toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, relationing activity in plasma and commander or each of effectiveness due to biodegradation, retaining activity in plasma and commanderics.

CC enterstance. They exhibit lower inherent mammallan cell toxicity, in plasma and contributed to biodegradation, retaining activity in plasma and commanderics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                     Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                       Rabbit platelet microbicidal protein, PMP-2, based peptide #102.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (HARB-) HARBOR-UCLA RES & EDUCATION INST.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example; Page 67; 221pp; English

å New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.

Example; Page 67; 221pp; English

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-10 amino acid core sequence (derived from 150 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and retromers. The protein structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and funsions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial antimicrobials, agents that enhance the antimicrobial for and as agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular belongy techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides exhibiting multiple antibicitic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against occanishms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBBX and its derivatives selected from the group consisting a second peptide template XZBZXBXBX XBBXXBBX and BBXZBBXZ; and (b) a second peptide template XBBXXXBX, XBBXXBBX, ABBXZXBBX; and (b) group consisting of XBBXBBX, and their derivatives selected from the group consisting of XBBXBBX, BXXXBXB, XBBXXBB, and XBBZXXBBXZBBX; where B = at least one positively charged amino acid; X = at least one anomatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide corts sequence (derived from 150 amino acide containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbioidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and funsions; and (2) antimicrobial peptides for potentiating antimicrobial activity of attimicrobial peptides are useful as individual antimicrobial agents or specifically against pacteria and fungi, agents in combination with other antimicrobial peptides are useful as individual antimicrobial agents that enhance the antimicrobial conventional antimicrobials, agents to improve efficiency of conventional antimicrobials, agents to improve efficiency of functions of leukocytes, as disinfectants or preservatives for use in foods and commercis and as agents to improve efficiency of conventional antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic creatstance. They exhibit lower inherent mammalian cell toxicits and and concerned problems of toxicity, immunogenicity, and schotness of defectiveness defences a rabbit pMP based antimicrobial peptides or the present sequence is a rabbit pMP based antimicrobial peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ఠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXXB, XBBXZXBX and BBXZBBXZ; and (b) a second peptide template XBBXXXB, XBBXXXBX, BXBBXXB, and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and Consisting of XBBXBBX, XBBXXBBX, BXXBXXB, ABBZXXBB, and Consisting of XBBZXBBX, XBBXXXB, BXXBXXB, ABBZXXBB, and consisting of XBBZABBX and their derivatives cone aromatic amino acid, and where B, X and Z man acid; Z = A least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of apoptosis of microbial cells. AANS7463 to AANS7757 represent sequences to sed in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

organisms such as pacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting sessentially of a first peptide template XZBZZBXBR and its derivatives selected to xZBBZBRXB. BXZXSB, BXZXZBBX and BBXZBBZZ; and (b) a second peptide template XBBXXB, BXZXXB, XBBZXBBX and BBXZBBZZ; and (b) a second peptide template XBBXXB and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXZBXXB, and XBBZXXBBX, WBBZXBBX, where B = at least one positively charged amino acid; X at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect callular disruption and rapid apoptosis of microbial cells. ANYS7463 to ANYS7557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                     Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amphipathic cationic peptide used in a novel gene delivery method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cationic peptide; nucleic acid delivery; intravascular delivery; parenchymal cell; nuclease degradation; DNA condensation; tissue targetting; membrane attachment; gene therapy.

The invention relates to a process for delivering a polynucleotide complexed with a compound into a parenchymal cell of a mammal comprising inserting the polynucleotide into a mammalian blood vessel and increasing the permeability of the vessel into an embodiment of the invention, the permeability of the vessel into me embodiment of the invention.

The polycations used include polycationic proteins such as histones and protamines, and synthetic polycationic proteins such as histones and protamines, and synthetic polycationic peptides such as polylysine. The polycations which may be important for gene delivery in vivo.

Additionally they allow attachnent of DNA to the target cell surface, and they can be used to attach specific receptors or ligands to the DNA, so that DNA/polycation complexes can be targetted to specific cell types. It was found that gene delivery and expression was most efficient when the overall net charge of the DNA/polycation complexes was negative (i.e., DNA negative charge > polycation positive charge), in contrast to prior att methods. The process of the invention is useful for delivering therepay of diseases not specified). The present sequence represents an emphipathic cationic peptide used in an exemplification of the invention.
                                                                                                                                                                                                                                      Delivering a polynucleotide complexed with a compound into a parenchymal cell of a mammal comprising inserting the polynucleotide into a mammalian vessel and increasing its permeability, useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This peptide was complexed with a luciferase reporter plasmid (pCILuc) and injected into the tail veins of ICR mice. After 24 hours, the mice were killed, the livers were removed and assayed for luciferase

New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance. WPI; 2002-590659/63

οŧ

Example; Page 72; 221pp; English.

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5150 amino acids containing a 7-13 amino acid core sequence (derived from the name PMP-1 and PMP-2, platelet microbiocidal protein), and retromers,

truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also or for potentiating antimicrobial peptide composition for direct activity or for potentiating antimicrobial apents active against organisms such as and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents of sentence that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents to manage that enhance the antimicrobial reforms and cosmetics and as agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in the foods and cosmetics and as agents to improve efficiency of molecular conventions and an adent of segment in a peptides of the present invention are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides of the present and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibite lower inherent mammalian cell toxicities and and and antimicrobial and and antimicrobial and and antimicrobial and and antimicrobial antimicrobial and and antimicrobial and and and anti overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide The invention relates to an antimicrobial peptide composition for use

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠ
                                                                                                                                                                                                                                                                                                                             The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide contentining a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers.

Truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fungion and (2) antimicrobial peptides for potentiating antimicrobial agents or general and fungi, agents in combination with other antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficiant antimicrobials, agents the inhance the antimicrobial for conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular companients and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistence. They exhibite lower inherent mammalian cell toxicity immunogenicity and short inherent mammalian cell definition of toxicity immunogenicity and short inherity against pathogens exhibiting and experimental and and an agent inherent mammalian cell definition of toxicity immunogenicity and short inherent mammalian cell definition and and an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                        New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide complex delivery method associated peptide segid 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention describes a polynucleotide complexed with a compound and delivered into the extravascular muscle cell of a mammal. The method comprises forming a polynucleotide-polymer complex having a zeta potential that is not positive; inserting the polynucleotide into a mammalian blood vessel. The method is useful for delivering a polynucleotide complexed with a compound into an extravascular muscle cell of a mammalian blood vessel in biologic systems. The inventive method allows the delivery of a polynucleotide to a cell to express an expension of an endogenous nucleotide sequence, to inhibit, eliminate, augment, or alter expression of an endogenous nucleotide sequence, or to express a specific physiological characteristic not naturally associated with the cell. The polynucleotides may be coded to express a whole or partial protein, or may be anti-sense. This is the amino acid sequence of a cationic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Delivery of polynucleotide complexed with compound into extravascular muscle cell of mammal, involves inserting polynucleotide in mammalian blood vessel in vivo, and increasing permeability of blood vessel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transfection; genetic material; mammalian cell; blood vessel; parenchymal cell; non-viral vector; DNA delivery; cationic peptide.

The present invention relates to a method for transfecting genetic material into a mammalian cell. The method comprises designing the genetic material for transfection, inserting the genetic material into a mammalian blood vessel, increasing permeability of the blood vessel, delivering the genetic material to the mammalian cell, and altering delivering the genetic material to the mammalian cell, and altering conjourning properties of the cell. Also disclosed is a method for delivering a polymucleotide complexed with a compound into a parenchymal cell of a mammal. This method involves making the polymucleotide-compound compound is chosen from amphipathic compounds, polymers and non-viral vectors, inserting the polymucleotide into a mammalian vessel, increasing the permeability of the vessel, and cell is increased by increasing pressure against vessel walls. The plood vessel consists of a tail vein. The parenchymal cell is chosen from liver cells, pance cells, heart cells, fairey cells, prostate cells, skin cells, testis cells, pancreas cells, thymus cells and lung cells. Diadder cells, brain cells, pancreas cells, thymus cells and lung cells. The present actionic peptide into a mammalian cell. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                    Transfecting genetic material into a mammalian cell, by designing genetic material, inserting genetic material into a blood vessel, increasing the permeability of blood vessel, delivering genetic material to cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The process involves delivering a naked polymuclectide to an extravascular cell outside of the blood vessel via the increased permeability. The method is useful in biological systems, e.g. for inhibiting expression of a gene in an extravascular mammalian cell. It is useful for inhibiting, eliminating, augmenting, or altering expression of an endogenous nucleotide sequence, or to express a specific physiological characteristic not naturally associated with the cell. The present sequence is a cationic peptide used in gene delivery. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting expression of a gene in an extravascular mammalian cell, useful for inhibiting, eliminating, or altering expression of endogenous nucleotide, comprises delivering polynucleotide to extravascular cell via
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA delivery; protein delivery; muscle tissue; ischaemic; blood flow; blood vessel; muscle cell; angiogenic factor; vascular endothelial growth factor; VBGF; fibroblast growth factor; FGF; angiogenesis; heart muscle; skeletal muscle; cardiac function; peripheral vascular disease; peripheral arterial occlusive disease; peripheral deficient vascular disease; myocardial ischaemia; occlusion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to the preparation of a compound for delivery to a active drug. The drug as a polymer in the presence of a biologically active drug. The drug is a polyion and the polymer (preferably containing a disulphide bond) is amodified in the presence of the polyion by (mixing with and) attaching a modecule. The molecule comprises a gene transfer enhancing signal selected from a nuclear localising signal, a ligand that binds a cell, and a releasing signal. The molecule changes the charge of the polymer and may be amphipathic, hydrophobic or hydrophilic. The mucleful for the delivery of nucleic acids, for condensing a nucleic acid, for forming nucleic acid binding polymers, for forming supramolecular complexes containing nucleic acid and polymer, and for
                                                                                                                                                                                                                                                                                                       polymer in presence of biologically active drug, useful e.g. for delivery and condensing nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             forming interpolyelectolyte complexes. The present sequence represents an amphipathic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    heterophase system; supramolecular complex; interpolyelectrolyte;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a process for delivering polypeptides or companient for improving or enhancing blood flow in the tissue. The process comparies injecting or enhancing blood flow in the tissue. The process comparies injecting contaked polynucleotides encoding the polypeptide into a blood vessel lumen in vivo, increasing extravascular volume in the muscle tissue, and delivering the naked polynucleotides to extravascular cells, especially muscle cells outside of the blood vessel. The polypeptide consists of an angiogenic factor such as vascular endothelial growth factor (VEGF) or fibroblast growth factor (VEGF). The permeability of the vessel is increased by inserting papaverine into the vessel prior to or together with the polynucleotides. The delivery of the polynucleotides stimulates angiogenesis in the muscle tissue. The muscle tissue is heart muscle tissue, particularly human heart muscle tissue, cor human limb skeletal muscle tissue. In addition, the delivery of the polynucleotide improves abnormal cardiac function. The patient has cor human limb skeletal muscle tissue. In addition, the delivery of the polynucleotide may stimulate vascular cell migration or peripheral vascular disease, peripheral arterial occlusive disease, peripheral cor the method is useful for delivering therapeutic prolynucleotides to a tissue suffering from corpusion. The present sequence isolatemia, vascular disease or an occlusion. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                             Delivering a therapeutic polynucleotide or polypeptide to a tissue suffering from or potentially suffering from ischemia comprises injecting naked polynucleotides into blood vessel and increasing the extravascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes the preparation of a compound for delivery to a cell by modifying a molecule (I) in presence of a polyion (II). The method is used to deliver mucleic acids to cells or organisms for analytical purposes, for the preparation of new materials, for the purlication of nucleic acids and for other recombinant DNA techniques, e.g., the production of sequence-binding molecules or for protecting specific sequences against nuclease digestion), and especially for drug delivery and gene therapy (e.g. treating inherited metabolic defects such as phenylketonuria or using antisense sequences to treat tumours or infections). Polymerisation can be performed in the presence of nucleic acids without chemical modification or loss of function of the nucleic acid; The method eliminates the need for aggregation and precipitation of acid. The method eliminates the need for aggregation and precipitation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amphipathic peptide monomer; drug delivery; nucleic acid-binding monomer; nucleic acid delivery; nucleic acid condensation; nucleic acid binding polymer; supramolecular complex;
                                 Preparing compound for delivery to a cell by reacting a molecule in presence of polyion, particularly for delivering nucleic acids, e.g. for
                                                                                                                                                                                                                                                                                                                                                     the nucleic acid and can produce consistent supramolecular complexes (including new and better-defined complexes of a relatively small size, better suited for delivery to cells) and at very high nucleic acid concentrations (in contrast to the use of preformed polylysine at low concentrations). Also polymers can be formed that can not be associated with a nucleic acid when preformed. The present sequence represents an example of an amphipathic peptide given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 46; DB 3; Length 20;

The polyion is preferably a polyanion and the compouex is preferably formed from the polyanion and an amphipathic compound or a cationic compound (especially histone, polylysine or protamine). The method is useful for making complexes useful for capitor of nucleic acids, condensing nucleic acids, forming nucleic acid binding polymers forming supramolecular complexes containing nucleic acid and polymer and forming an interpolyelectrolyte complex. The present sequence is an amphipathic peptide monomer useful in forming a polymer of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compsns. for treating infections sensitive to beta-lactam antibiotics - comprise beta-lactam antibiotic and cationic oligopeptide, useful against Enterobacteriaceae, Pseudomonas aeruginosa etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alpha-

Patent No. 6743769

GENERAL INFORMATION:
APPLICANT: Yeaman, Michael R.
TITLE OF INVENTION: Antimicrobial Peptides and Derived
TITLE OF INVENTION: Antimicrobial Peptides
TITLE OF INVENTION: Metapeptides
FILE REFERENCE: 66742-025 (HRS644)
CURRENT FILING DATE: 2000-03-13
PRIOR APPLICATION NUMBER: US 09/025,319
PRIOR PILING DATE: 1998-02-18
NUMBER OF SEQ ID NOS: 39
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 3
LENGTH: 18
                                                                                                                                                                                               0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 10. Application US/09525269A
Patent No. 6743769
GENERAL INFORMATION:
APPLICANT: Yeaman Michael R.
APPLICANT: Shen, Alexander J.
TITLE OF INVENTION: Antimicrobial Peptides and Derived
TITLE OF INVENTION: Metapeptides
FILE REFERENCE: 66742-025 (HR5614)
CURRENT APPLICATION NUMBER: US/09/525,269A
CURRENT FILING DATE: 2000-03-13
                                                                                                                                                                                                                                                                                                                  OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 45811, Application US/09270767

Patent No. 6703491

GRNERAL INFORMATION:
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REFERENCE: File Reference: 7326-094
CURRENT PALLICATION NUMBER: US/09/270,767
CURRENT PILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 45811
LENGTH: 52
                                                                               APPLICANT: Homburger et al.
